## ##Setting up the project

Follow these steps for setting the project in your local machine

1. Clone the repository (you will find a client directory inside the same)

2. In the terminal go to the client root directory (D:\PlanetSpark-Assignment\client)

3. Run the command **npm install** (This will install all the necessary modules that I've used & you will see a node_modules folder inside your client root directory)

4. Now project setup is done

5. In order to run the application in your local machine

   Open the terminal in the client root directory  OR do the step-2

   And run -> **npm start**  (This command will run the application in your local & you'll see the application running on default port i.e. 3000 )
